A WEB-BASED INVENTORY TRACKING AND MANAGEMENT SYSTEM

FOR PESTASTIC PEST CONTROL SERVICES

SYSTEM MANUAL

Introduction

The Web-Based Inventory Tracking and Management System is strictly intended for use by the pest control company Pestastic. This system manual will show the proper way to completely utilize the system.

If you have any concerns regarding the system and its manual, do not hesitate to reach out or contact us at officialpestasticinventory@gmail.com.

System Contents

The Web-based Inventory Tracking and Management System is a system that offers features to track the company's inventory items especially its usage at the integrated transaction and queue system.

Use of System Manual

This system manual serves as a guide for the targeted staff of the Pestastic Pest Control company such as:

- Managers
- Operations Supervisor
- Technicians

Logging Out

When logging out, the user will just need to click the button with the person icon— at the right side of the navigation bar (top right of the screen). This will toggle the account settings and below the settings will be the log out button. When clicked, this will log the user out and redirect the user back to the landing page.

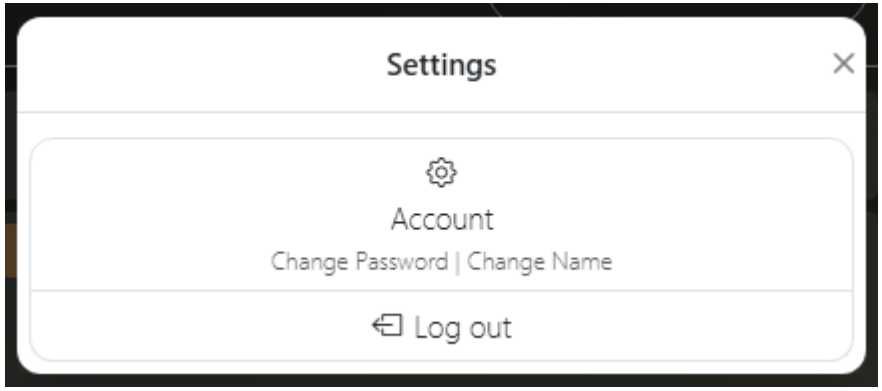

Table of Contents

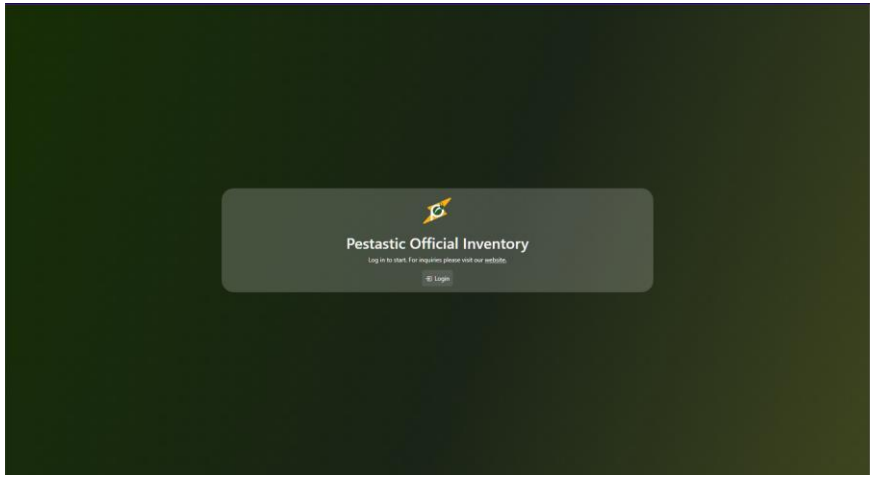
Inventory Management	16
Inventory—Add Stock/Add Entry	18
Queue Feature	19
Transaction Management	20
Transaction Management—Buttons	22
Transaction Management—Transactions	24
Logging Out	29

Landing Page

In able to access the web-based system, the user will be required to open any kind of browser. At the address bar, type **"pestastic-inventory.site"** and press enter to proceed. The browser will redirect the user automatically at the landing page of the system.



This is the system's home page or default page when no user is logged in. This can also warn the user that the company's inquiries are on a separate website. The user can view the official website made for the clients by clicking the underlined "website" in "visit our website" part. The user is required to have an account and to login, just click the login button at the center.

Login Page

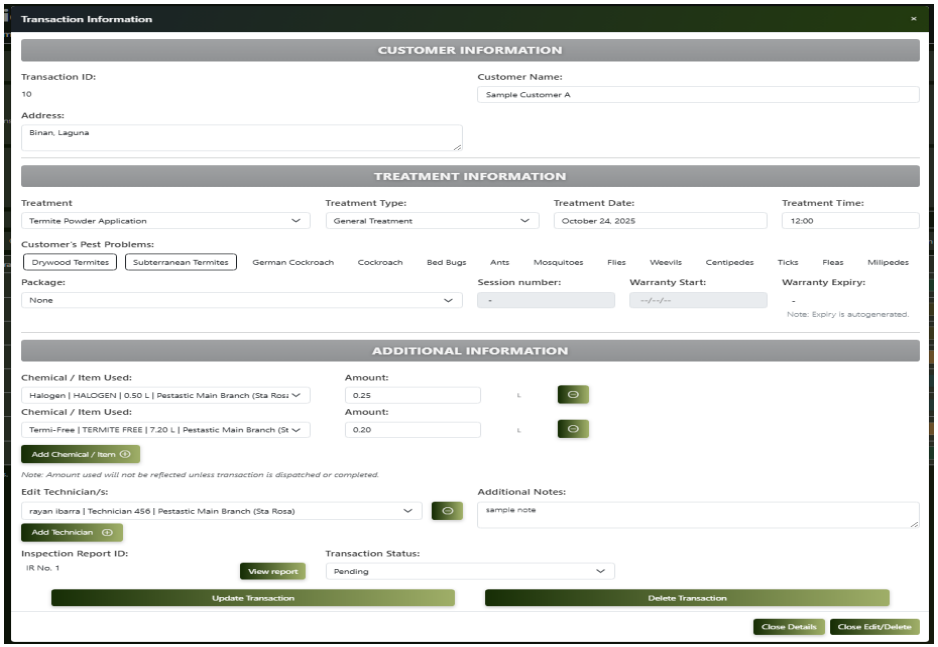
The login page (p.2), will consist of inputs for username/email, and password. The user also has the choice to reset their password once forgotten. This system will not have a self-create account as every account is made by the Manager or the user with highest access.

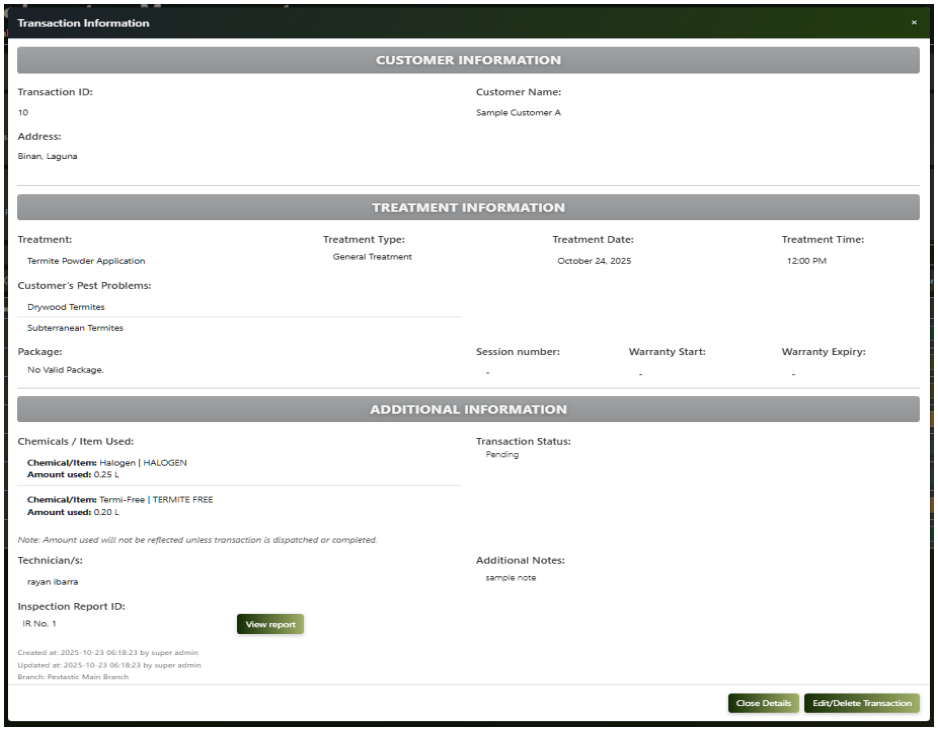
To update the transaction status, the manager can update directly at edit feature, however the basic way is to hover at the status pill under the status column and click. The status will change into the next status when hovered and a modal that asks necessary details will pop-up (except for Completed & Voided).

Technicians however, are limited to only Dispatch and Finalize transactions. Dispatching a transaction will ask and confirm for the amount of item to dispatch while Finalizing will ask and confirm the amount left from dispatchment.

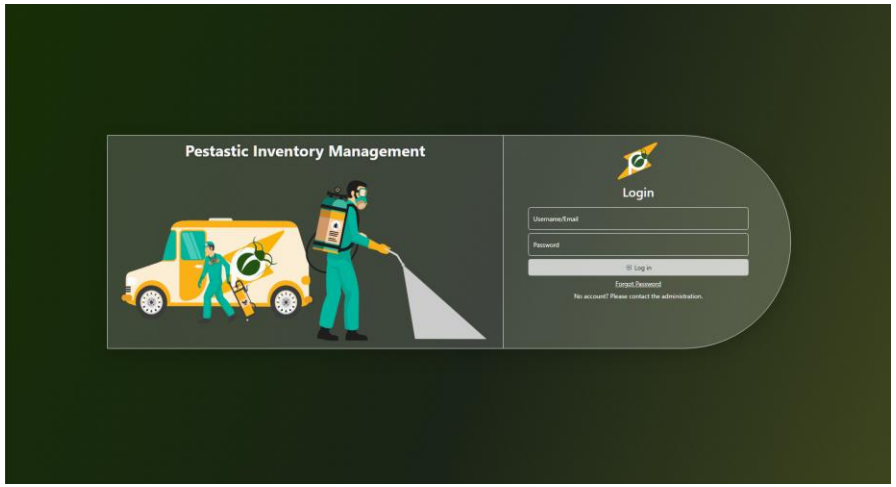
Completion of transactions are available only to supervisors and managers, this stage will ask for the final amount left from the finalizing report of the technicians.

For cancelled, the status will also display cancelled however when treatment date has passed, the column under treatment date will display a warning button. When clicked, a reschedule form will appear. The same form/modal will appear when cancelled status is clicked. This will allow the user to reschedule the transaction with ease.

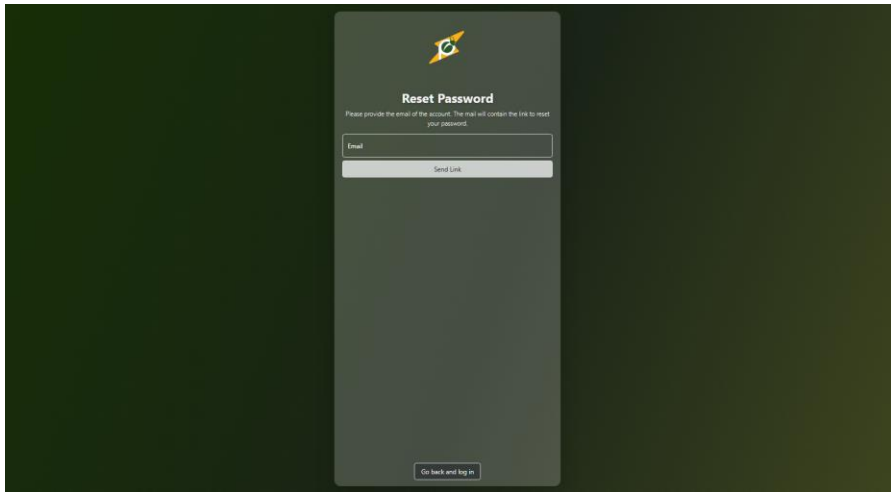




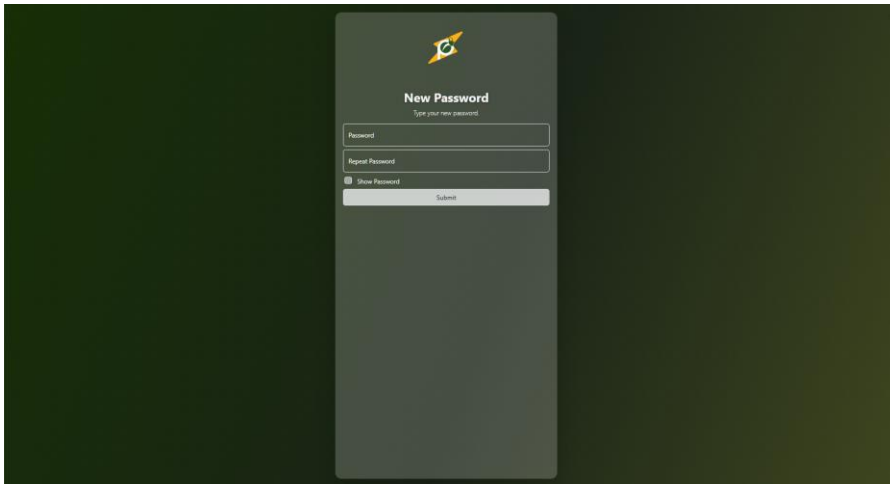
Below is the demonstration of the login page.



Meanwhile, the forgot password is demonstrated below. Note that this function only works for registered emails if the user's email is not found, it will throw an error.



The link with the integrated reset token of the password reset will be provided at the email inbox of the email the user had entered.



Moreover, the reset password function's purpose is to aid forgotten password cases. If the user has not forgot the password, the user can just proceed to login.

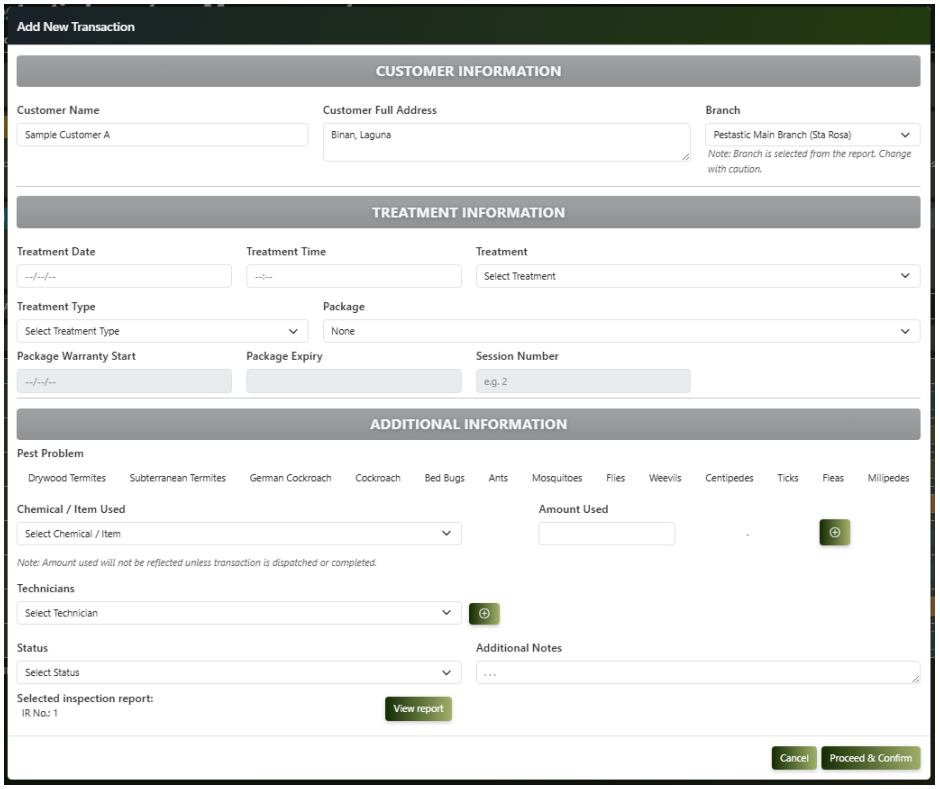
User Types

The user has three user types: Manager, Operations Supervisor, and Technician. Manager is the highest and absolute access while technician is the lowest.

Regarding the login function, the user will just need to enter their registered account details and the system will automatically redirect the user to its own respective dashboard.

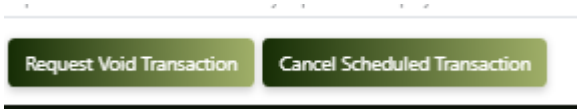
Dashboard

The dashboard is tailored depending on the user type's daily operations (See p.6 for Manager Dashboard Snapshot). Other user share almost the same dashboard with slight distinct changes due to user access limitations.

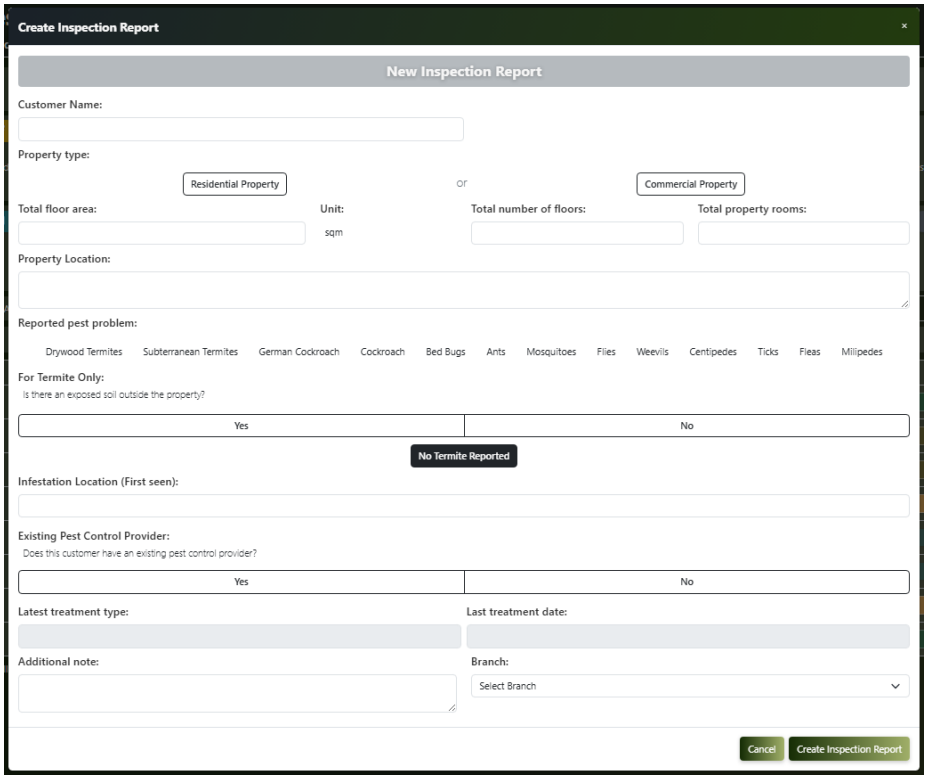


The snapshot above shows the whole form of adding a transaction. Take **note** that the **'package warranty start', 'package expiry', and 'session number'** will only be available when a package is selected. A **selected package** also means that the **treatment is fixed**, therefore the **treatment select** will be **disabled**.

To view a transaction, the user will need to click at the '**details**' button at the action column inside the table (see p.21). This will open the transaction details modal (see p.27) which includes multiple functions such as the **edit toggle**, **request void** (except for completed), and **request cancellation** (for pending and accepted), see snapshot below. However, request void and request cancellation is **unavailable for managers** since they can directly adjust the status select itself while other **users' status select are limited**.



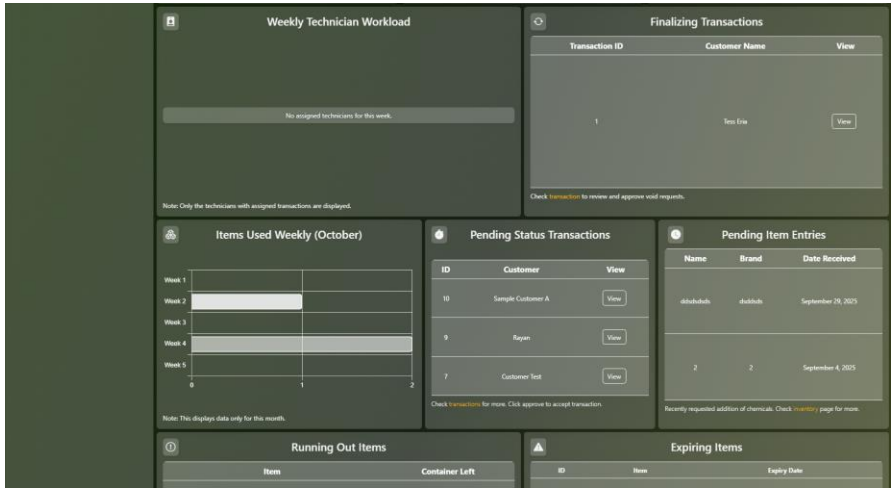
To **create** an **inspection report**, the user will either click the '**create new report**' on the select report modal or directly beside the add transaction button. This will open the modal with the form that consists of the required details for an inspection report (see snapshot below).

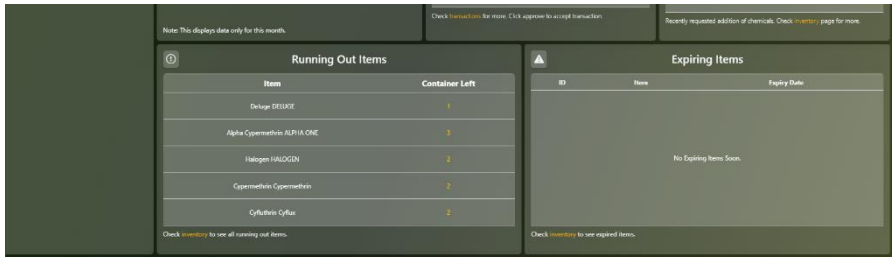


Note: Inspection reports can be created and modified by all users, however deletion is a feature only for managers.

After the required report, the user can proceed to creating a new transaction by selecting the respective report at the report selection modal. After selecting a report, the button '**create new report**' will **automatically change** into '**proceed'** and when clicked, the user will be taken to the add modal for transactions. The 'customer name', 'customer address, and 'branch' will **automatically be filled** based on the report but is still editable (see p.26).

The snapshots below are the dashboard of the Manager user which shows multiple data such as the pie chart of a transaction summary, line chart of yearly transactions, top technicians, etc.

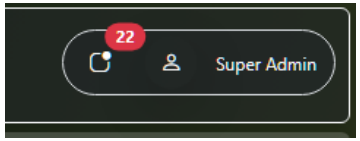




Navbar Contents

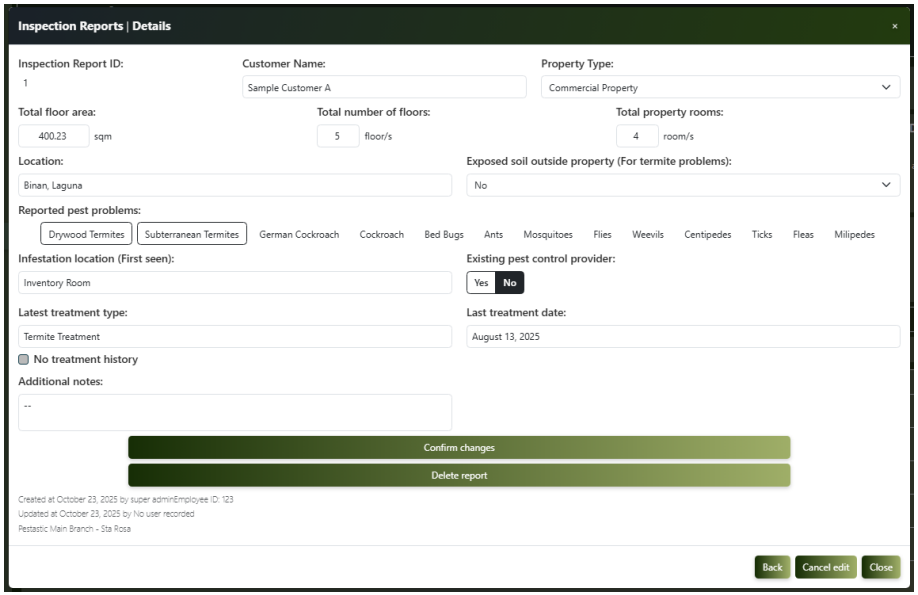
The navbar content will be the same across different users with changes related to the contents of the system. The contents displayed are the basic information of the current time, date, system title, and the name of the logged user at the utmost right part of the bar.

On the upper right part of the system's navigation bar, contains the alert and the settings of the account. For Managers, the account settings — will not only contain the user information, but also the content the system will have. Meanwhile the alerts button will provide the sufficient alert messages of the user type of the logged user.



Managers will have alerts of the following (see p.8 for the snapshot), while other users will be limited to a few alerts:

- Items beyond restock threshold (low items)
- Pending, Finalizing, Cancelled, & unfinished transactions.
- Item entries for approval.
- Transactions with void requests.
- Upcoming transactions.
- Abandoned or not updated transactions.

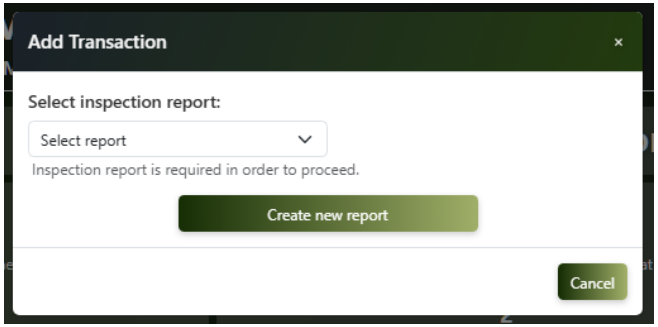


Meanwhile, clicking **finalizing transactions** will show a modal with transactions that have the status of **finalizing**.

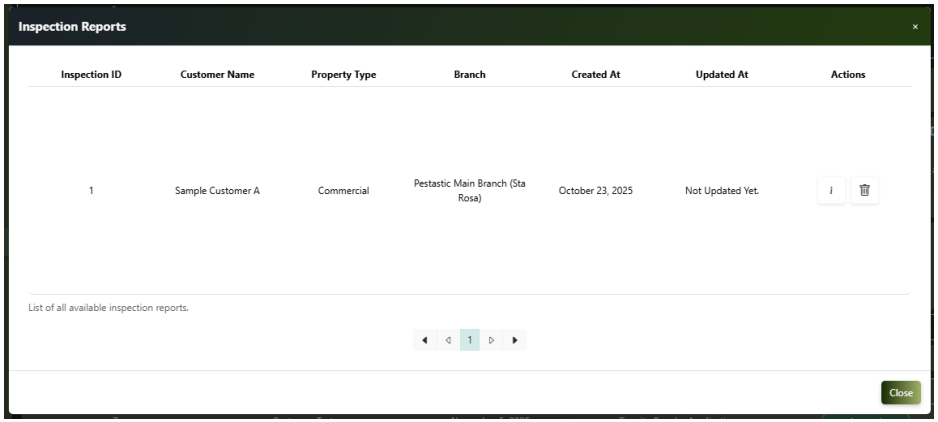
On the right side, the **add transaction** and **add inspection report** will open the modal with its respective form in order for the user to add new data.

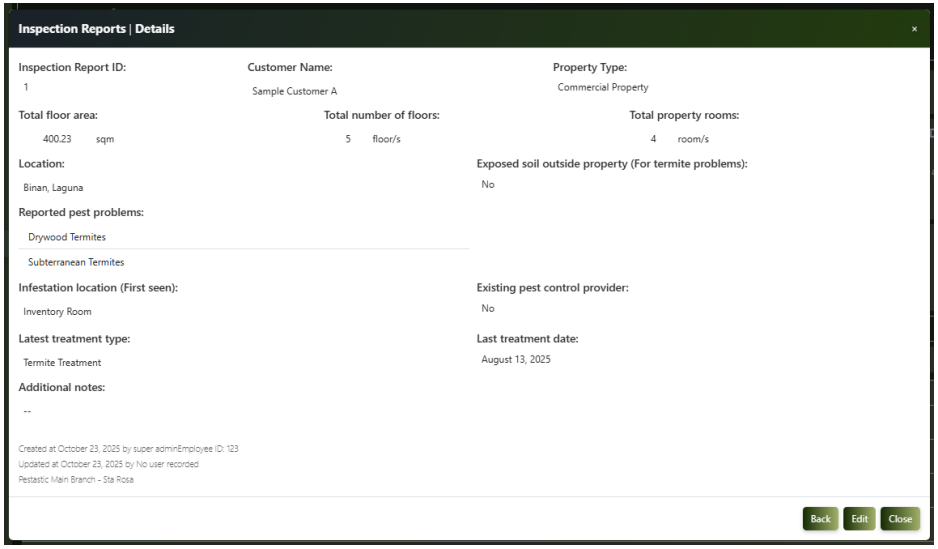
Transaction Management—Transactions

To add a new transaction, the user will be asked to include an inspection report, a modal will provide the user **existing reports** or a button to add a new one (see snapshot below). Each transaction will have an inspection report bind to them and the system will not allow the user to continue if there is no chosen report.

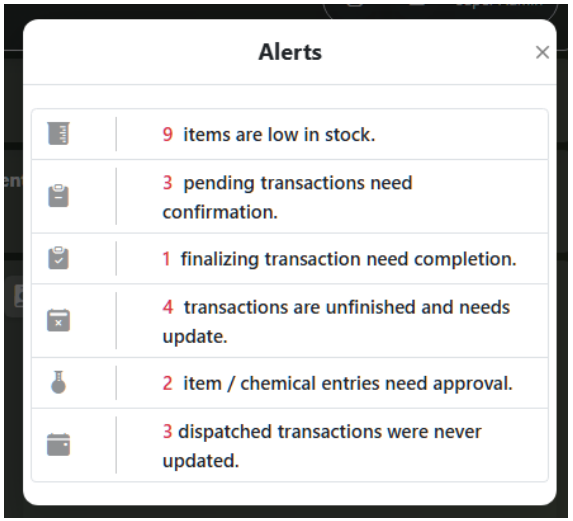


To **view** the inspection report, just click the button with **'i'** on the actions column and the modal which consists of the inspection report's details will pop-up.



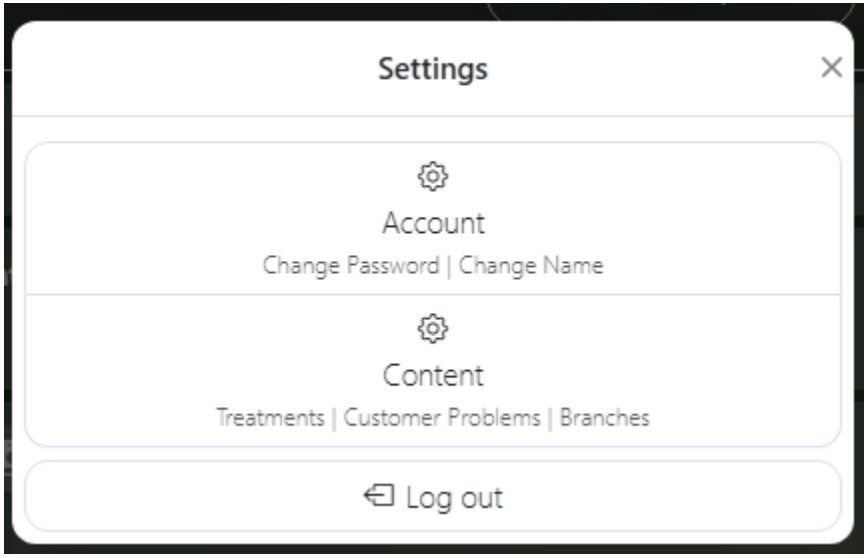


To edit the report, the user will just need to click the **edit button** on the lower right of the modal and the data will switch into inputs, checkboxes, & radios that allows user to edit each detail (see p.24).



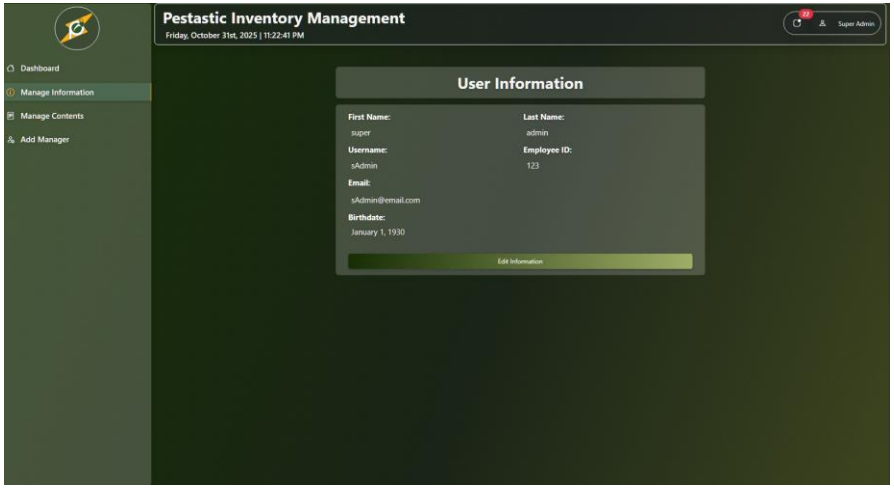
These alerts will also take the user to the respective page when clicked for faster and smooth function.

Meanwhile the settings modal of the Manager looks like the snapshot below, however, for other users, content section is not available.



Account Settings

Account settings will be the basic information settings of the logged in user.



In order to edit the information, the user will just need to click the **Edit Information** button to toggle the input.

This will change the appearance and show the editable inputs of each detail (see p.10).

When changes are final, the user can submit the changes and enter the necessary validation in order to save each new detail.

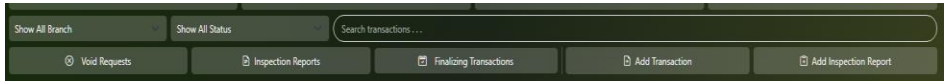
The system will only ask for the old or existing password of the logged user in order to finish changes (see p.10).

Cards displayed at the top of the transaction page snippet (see p.21) are every transaction status existing in the system. The status flow is as follows:

Pending -> Accepted -> Dispatched -> Finalizing -> Completed

Meanwhile, **Voided** & **Cancelled** can be applied only on **Pending** and **Accepted**.

Transaction Management—Buttons



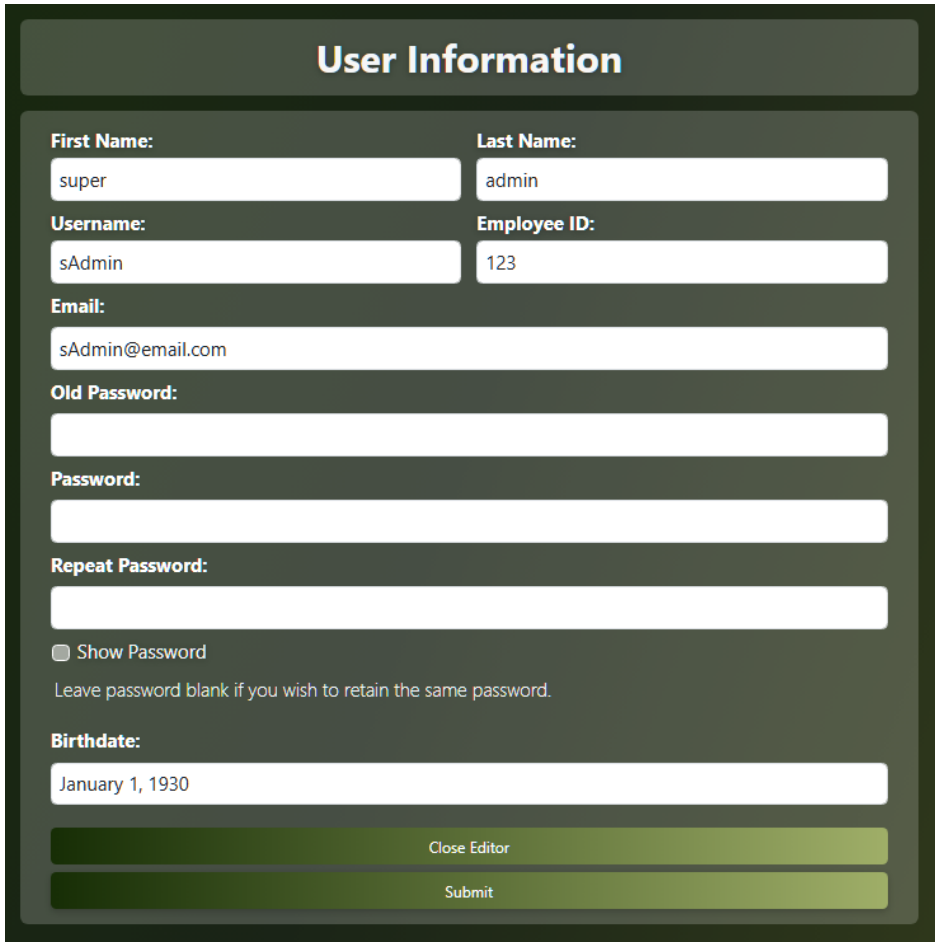
Starting from the left part, the **branch selector** will contain the available branches and sorts each and every data in the page including the contents of the buttons at the second row. Note that this button will only be available for Managers.

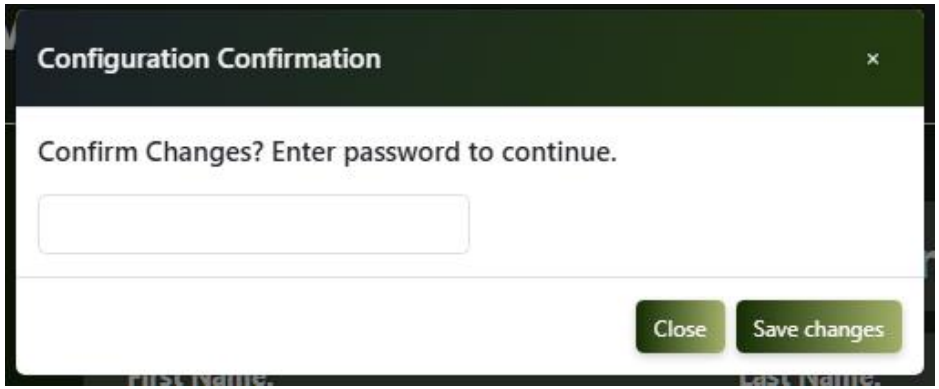
Meanwhile, on its right side is the **status select filter** which filters the status of the displayed data at the table below these button group. Alongside these buttons is the **search box** which gives the user the ease to search for data more specifically.

On the second row, click the **void requests** button to open the modal which has the table of **transactions with void requests**. **Note** that only the manager has access to **approving** and **disapproving** such requests.

Click **inspection reports** to open the modal consisting of all the reports. In the modal, the user can also **view** and **edit** each respective report, while the **trash bin button** will **delete** the respective report and **is limited to managers only**.

Manager	Operations Supervisor	Technician
View Transaction Modify Transaction Add Transaction Void Transaction Reschedule Transaction Cancel Transaction Add Inspection Report Modify Inspection Report Delete Inspection Report	View Transaction Modify Transaction Add Transaction Reschedule Transaction Cancel Transaction Add Inspection Report Modify Inspection Report	View Transaction Add Transaction Add Inspection Report





Manager—Manage Content Settings

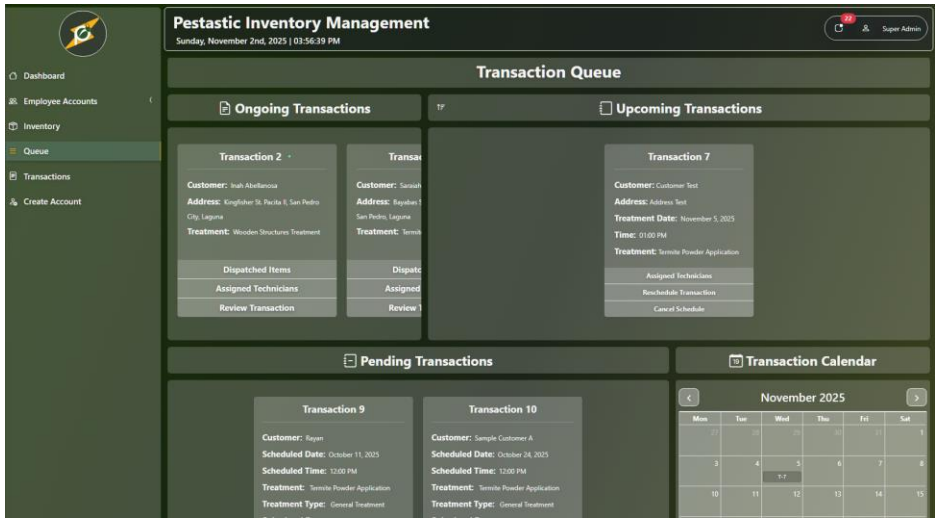
Another setting that falls under the only user, Manager, are the contents of the system.

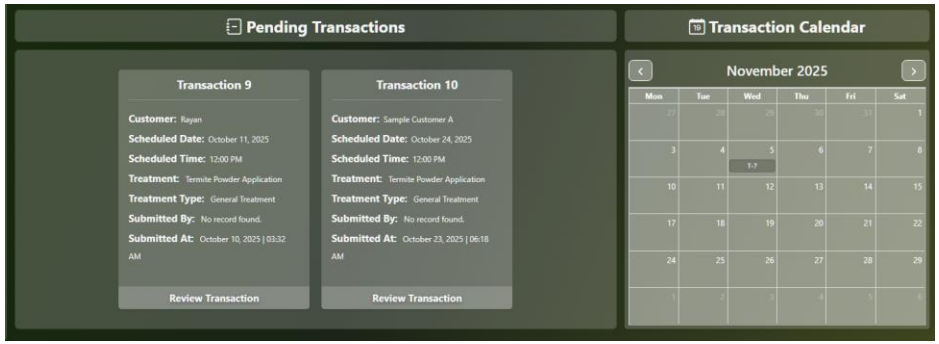
The editable contents of the system will be available for use at the forms of the system that will serve as a basis of various information. The contents that can be modified are as follows;

- Offered Treatments
- Pest Problems
- Branches
- Packages

These contents require logged user password whenever the user wishes to modify each data. Add data, the user will just need to click **Add More** located at the bottom of each table and a modal (see p.12) will show a form and will require the user to input the necessary data.

When deleting a data, the user will just need to select the checkbox— at the first column of the table or the left most side and click **Delete Selected** to confirm deletion.





The user can also cancel the schedule of the upcoming transaction, however, is not available for the user technician.

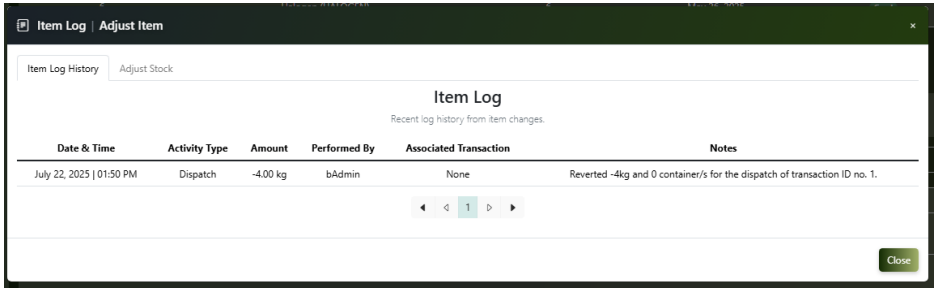
Meanwhile, clicking the **review transaction** and the box with transaction ID inside the transaction calendar will redirect the user to the transaction page and the system will automatically open the selected transaction.

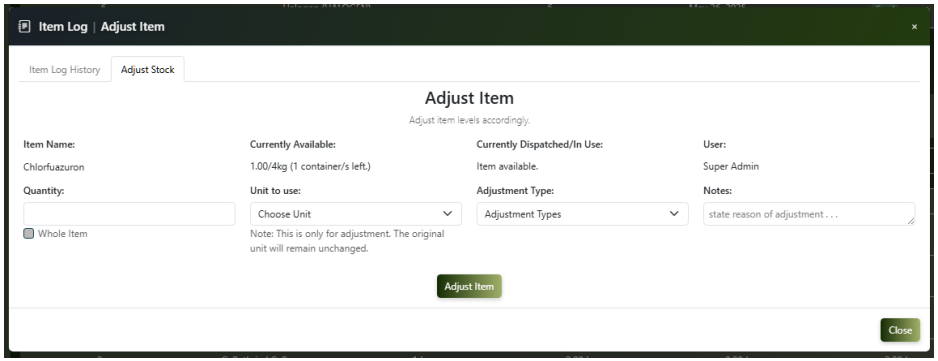
Transaction Management

Similar to inventory management, transaction system also has different user access to each feature. The table on **p.21** demonstrates the summary of how user types access each feature.

Item Used Summary and Container Status Report have different actions than the main table.

The **journal** icon button will open the item log of the responding item. Along with the item's log is the **adjust stock**, this function adjusts the item for other reasons beside getting automatically deducted from transaction use.



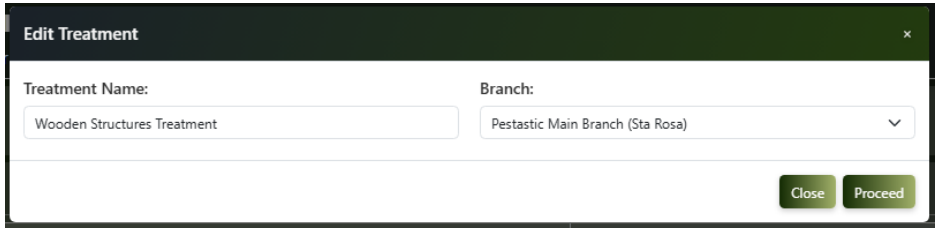


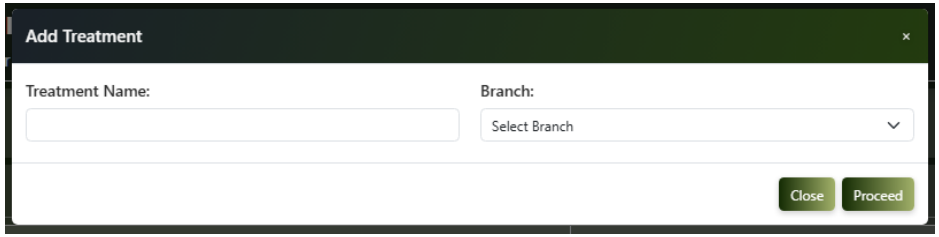
Queue Feature

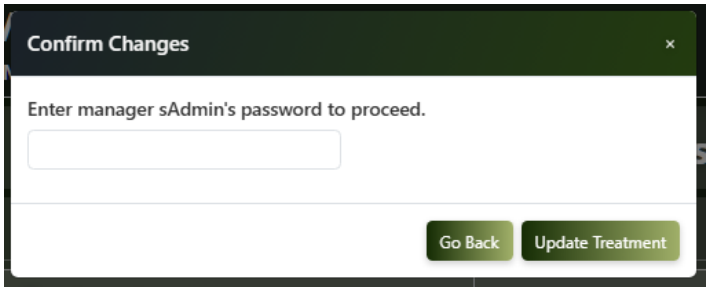
The queueing feature is a real time display of **ongoing, upcoming, & pending transactions.** This page also displays a calendar that the user can search to see transaction IDs on their respective date.

The user can also view dispatched items and assigned technicians on these displayed transactions. Every card of transactions displays brief and important information derived from its own details (see p.20).

To edit a data, the user will only need to click the **Edit** button at the last column of the table or the right most side. This will open the edit modal consisting of the inputs with the respective details of the selected content.



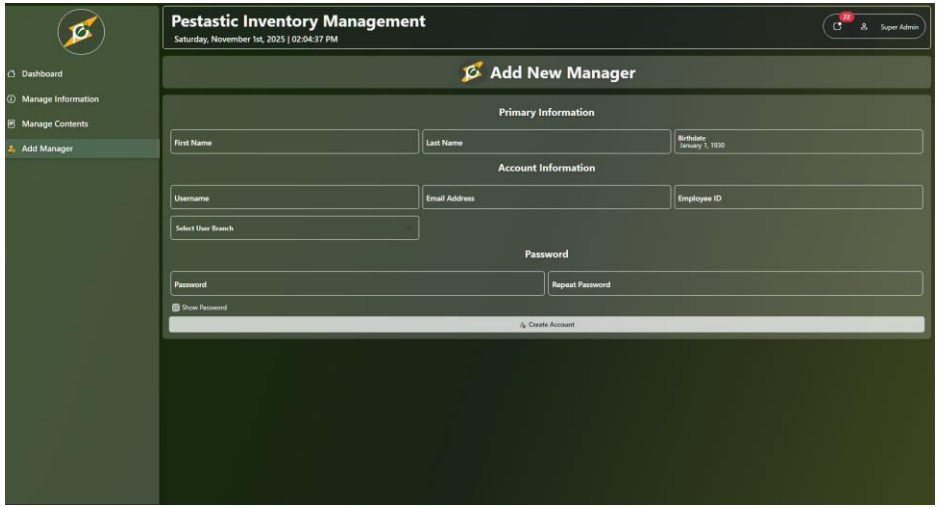




Note: Every modification will require the password of the logged user for security purposes.

Manager—Add Manager

The manager user can also add manager accounts but is limited to controlling them. Unlike the manage account function managers have for Operations Supervisors and Technicians, managing managers account is not available at this system. (For account management feature, proceed to p. n).



Note: this feature will also ask for the logged in user's password before proceeding.

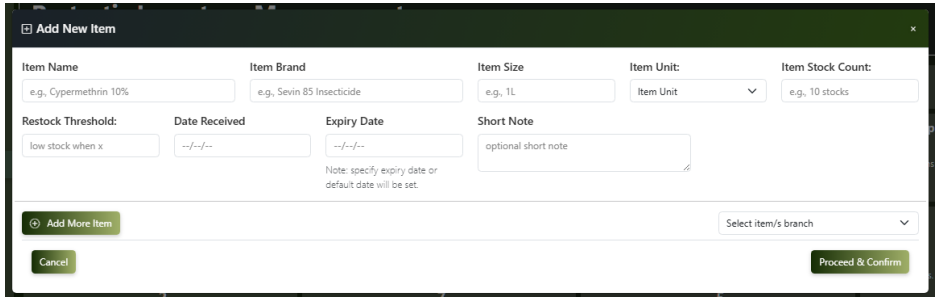
Manager—Account Management

To manage accounts, the manager user would be able to navigate the **Employee Accounts** and **Create Account** (see p.14) at the side navigation bar on the left.

The button/dropdown **Employee Accounts** (see p.14), when clicked, will show the two other lower access user types (Operations Supervisor & Technician).

Inventory—Add Stock/Add Entry

The user will just need to click the button with a plus logo beside the **Item Logs** button at the right part of the search input. This will open the modal which consists of inputs required for each inventory item.

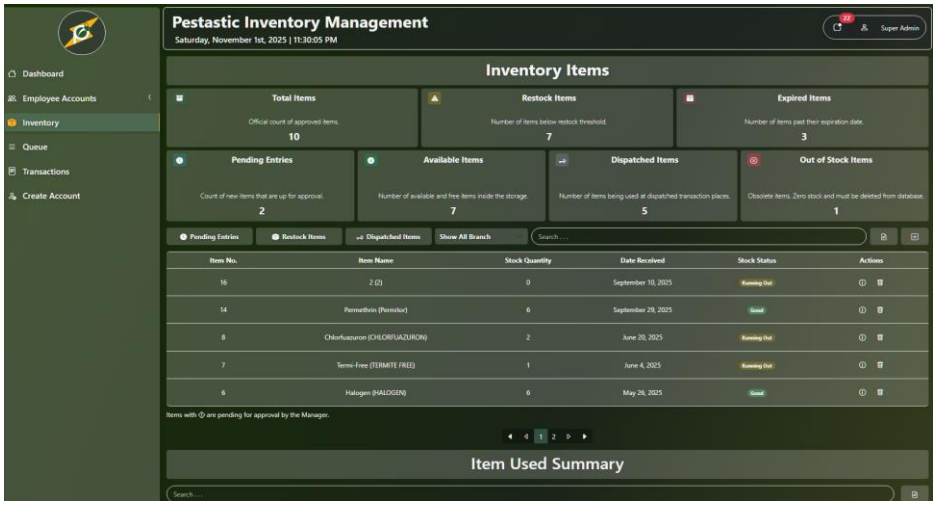


Note: branch selector is only available for the manager, other user is limited to their own branch.

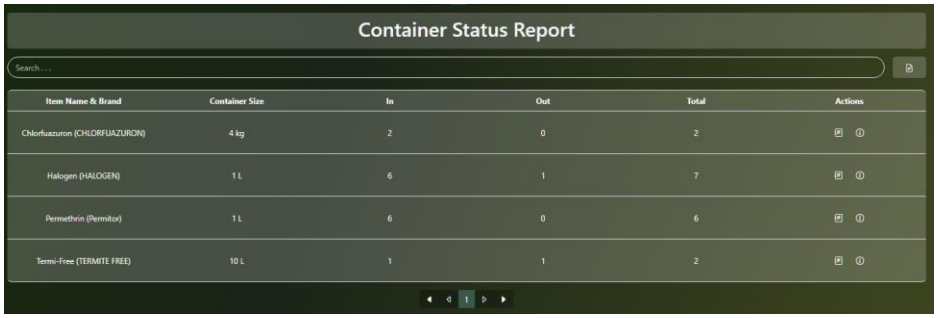
Meanwhile the other buttons serve different purpose. **Item Logs**—opens the history log of all the items. This is the button before the add entry button; **Branch Select**—filters the items of every table and data of the inventory page in their respective branch; **Dispatched Items**—shows items assigned on a dispatched transaction; **Restock Items**—shows items where count is lower or equal to their restock threshold; **Pending Entries**—newly added items up for reviewal and approval of the manager.

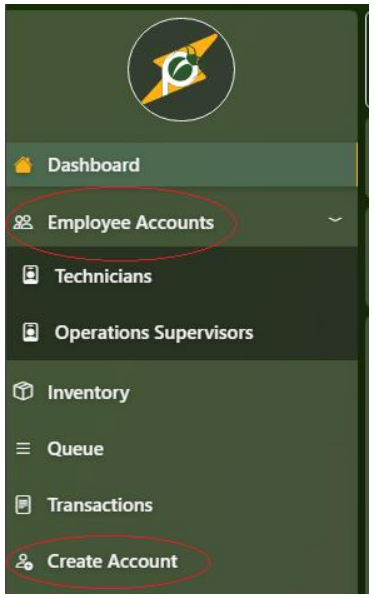
Buttons at the action will also serve different purpose. The button with **'i'** will open the details of the item, along with the edit toggle that switches each data into editable inputs allowing the user to change **only** the details of the item.

Note: trash bin icon/button is only available for manager users only due to user access limitations.

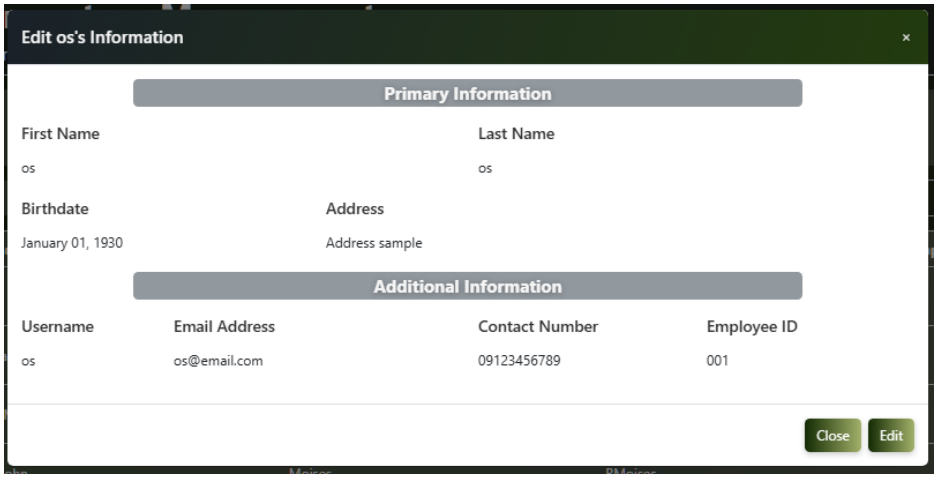


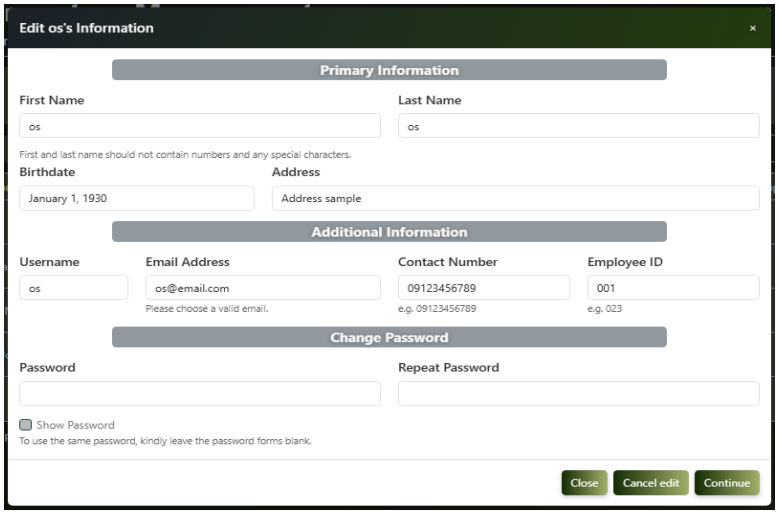
The inventory displays multiple useful information as demonstrated at the snapshot above. The inventory page displays three main tables: the main table, item used summary, and the container status report (see below).





To modify or delete an employee (either Operations Supervisor or Technician), the user will only need to click a button from their respective row. On the action column are two buttons, the view/edit and the delete buttons.

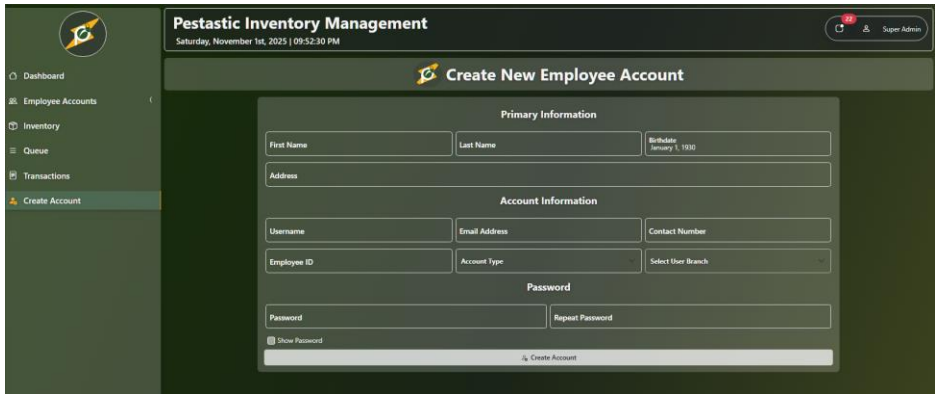




Note: Operations Supervisor and Technician page have the same UI and functions as displayed on the snapshot above.

The manager can also filter the accounts based on their branch and search.

In order to create an account, the user would only click at the Create Account button on the left side navbar. The user is required to fill in the necessary details of the new employee or the new user. Click Create account to proceed and finalize.



Note: account type is an indicator of the two lower access users—Operations Supervisor & Technician.

Inventory Management

Users have different user access to inventory, see table for the summary of each function access.

Manager	Operations Supervisor	Technician
Stock Viewing Stock Modification Stock Addition Stock Deletion	Stock Viewing Stock Modification Stock Entry	Stock Viewing
